

## Now Install WordPress on Server

Wednesday, April 19, 2023 11:37 AM

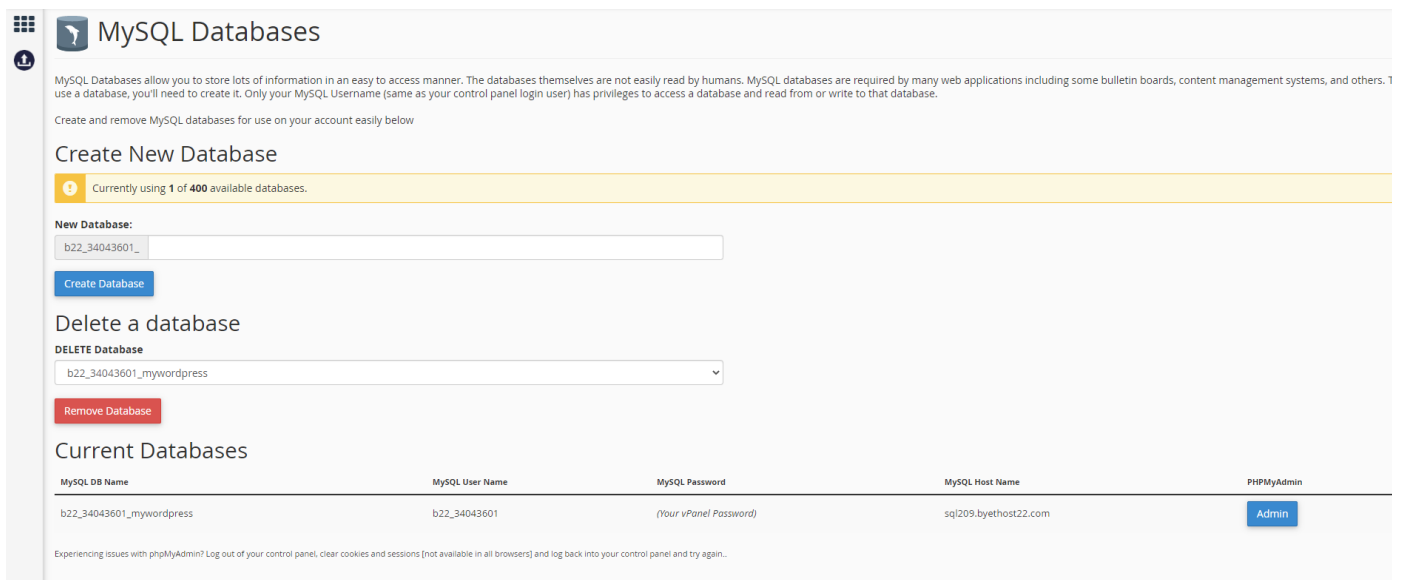

Okay, I have successfully uploaded WordPress onto byethost server using FileZilla. Now when I visit the URL I see this????

Uh OH!!! It is looking for a database???? Uhm.....let me create one on the server using the byethost dashboard

Use MYSQL to create a wordpress database!

Fill in this information into WordPress install

Below you should enter your database connection details. If you are not sure about these, contact your host.

Database Name	<input type="text" value="b22_34043601_mywordpress"/>	The name of the database you want to use with WordPress.
Username	<input type="text" value="b22_34043601"/>	Your database username.
Password	<input type="text" value="password"/>	Your database password.
Database Host	<input type="text" value="sql209.byethost22.com"/>	You should be able to get this info from your web host, if localhost does not work.
Table Prefix	<input type="text" value="wp_"/>	If you want to run multiple WordPress installations in a single database, change this.

[Submit](#)

And then you get this screen, success!

All right! You've made it through this part of the installation. WordPress can now communicate with your database. If you are ready, time now to...

[Run the installation](#)
